17<sup>th</sup> Cyber Security Experimentation and Test Workshop

Tuesday, August 13<sup>th</sup> 2024

Philadelphia, PA, USA

# Outline

- Problem motivation and prior work
- Overview of our system: NERDS
- Case study of using NERDS in two developer studies
- How you can use NERDS

# Problem motivation and Prior Work

# We study Developers

- Understanding developers is key to understanding software vulnerabilities
- Studying developers is challenging, as exact environments are hard to replicate

# Studying developers remotely

Developer studies can be done remotely with a few key tradeoffs:

## Advantages

- Larger recruitment pool
- Less time consuming
- Less expensive
- Data collection can be fully automated

## Disadvantages

- Difficult to fully replicate environment
- Developing online platforms from scratch is expensive and time consuming
- No cognitive walkthroughs

# Prior Work

- **Developer Observatory** (Stransky et al., 2017): platform for remote Python studies
  - Forms the basis for our work
  - Remote studies were easier and faster than in-person studies
  - Data collection limited by nature of remote study
- **OLab** (Huaman et al., 2022): Provides full remote desktop interface for remote developer studies

# Limitations of Prior Work

- Developer Observatory
  - Limited scope – only works with Python studies
  - Limited to 20-50 concurrent users
  - Users complained about long-wait times to start study
- OLab
  - Heavier system than what we needed
  - Not open-sourced
  - Appears to only be tested with loads < 25 participants

# System Overview

# Requirements

- **Participant Experience**
- **Experimental Design**
- **Technical Requirements**

# Requirements (cont.)

## Participant Experience

- **Non-invasive:** system should place minimal requirements on the user's system to participate
- **Flexibility:** Ability to leave and return the study at any point
- **Skip-revisit:** Skip and revisit tasks participants are struggling with

# Requirements (cont.)

## Experimental Design

- **Randomization:** randomized condition assignment and task order
- **Control/Real-world:** Researchers should be able to control environment while replicating real-world environments
- **Data collection:** Data should be gathered as much as possible without being over intrusive
- **Ethics:** Data should be stored securely with a pseudonymous identifier

# Requirements (cont.)

## Technical Requirements

- **Isolation:** full isolation between participants, including access and DoS
- **Scalability:** System should handle many concurrent participants at once
- **Adaptability:** System should be adaptable to other study designs

# Our system: NERDS

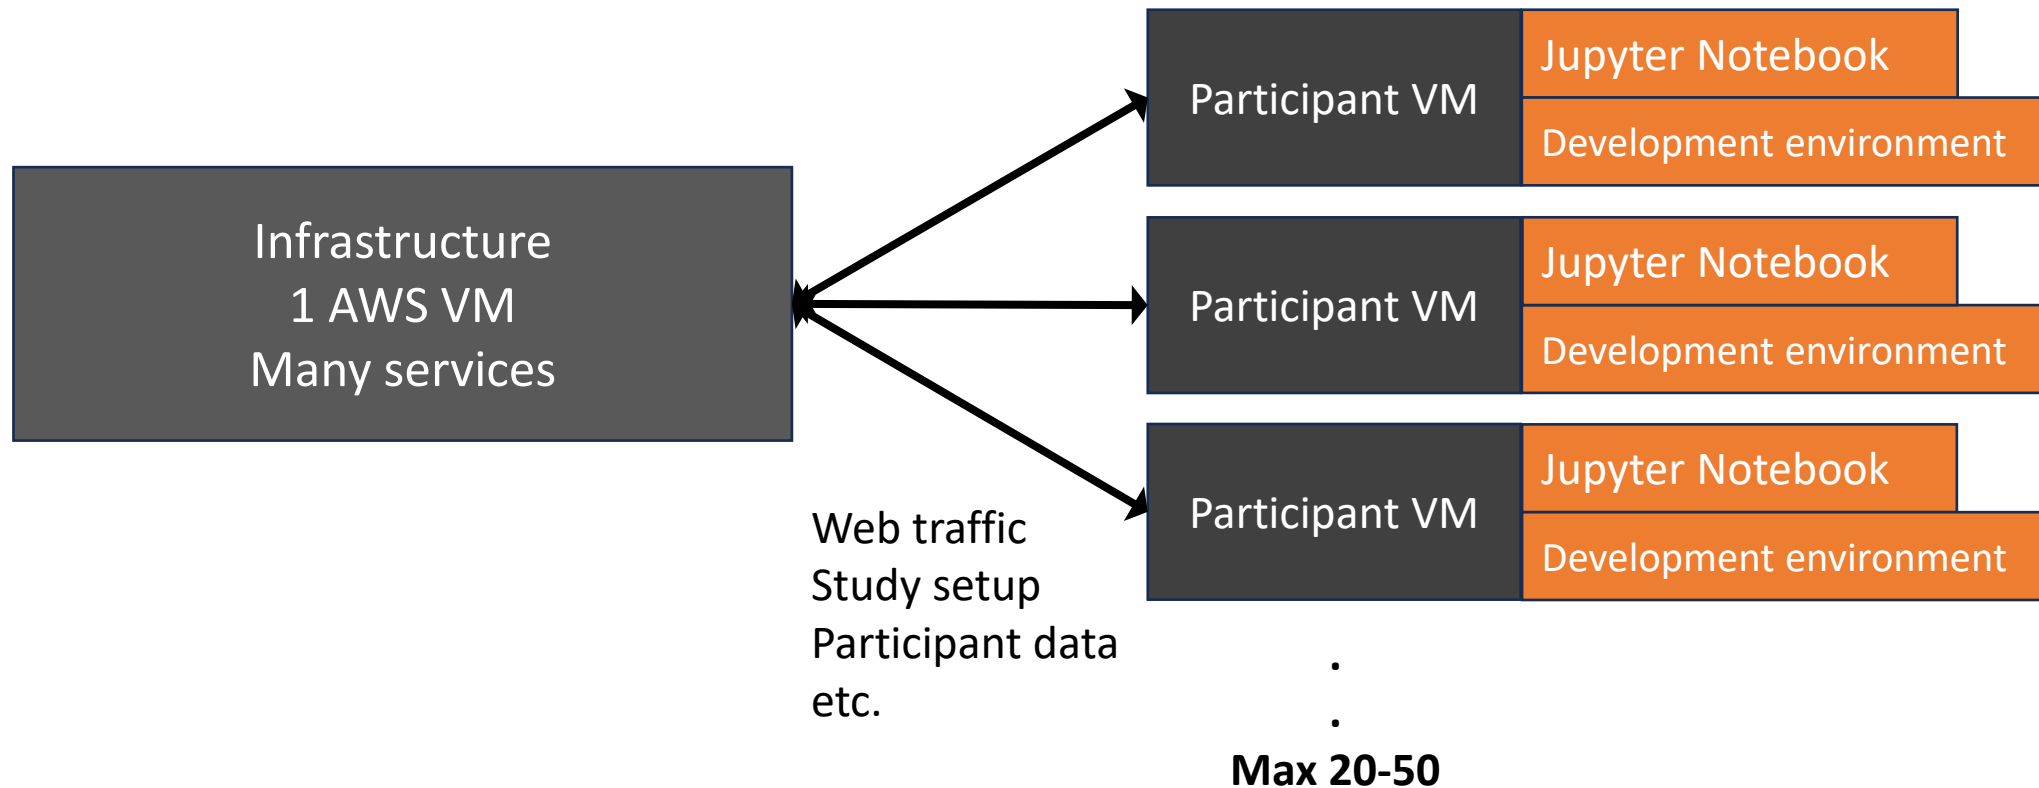

What is it?

An environment for hosting browser-based remote developer studies.

Heavily-modified version of Developer Observatory from Stransky et al.

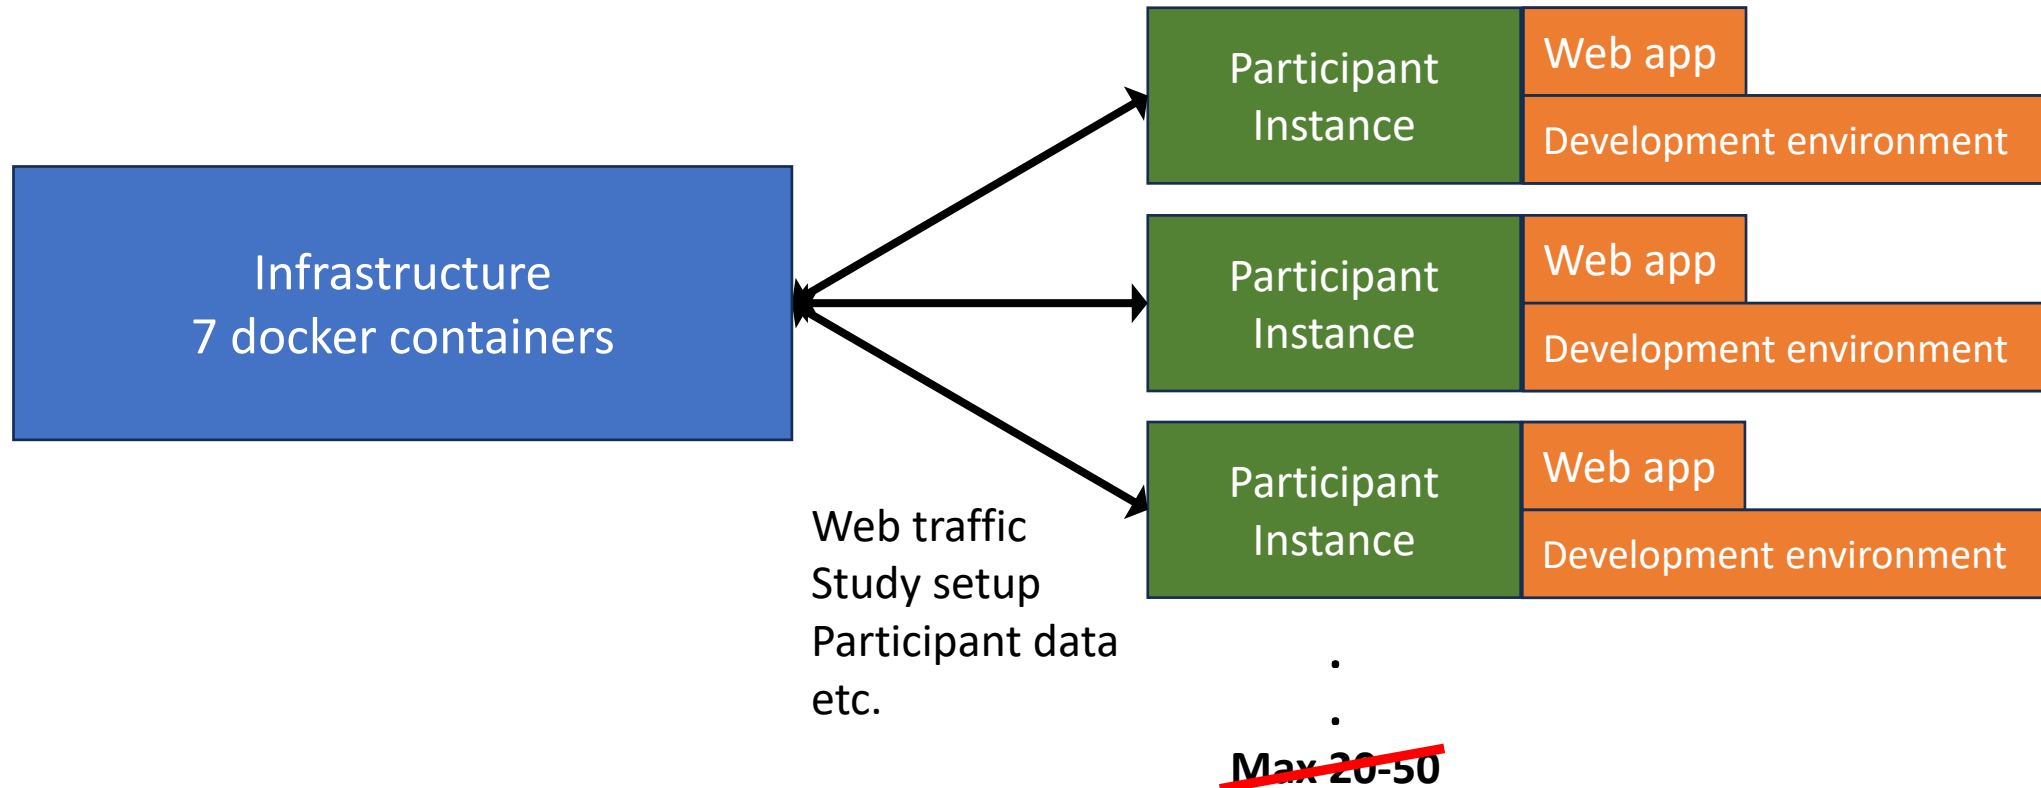

# Technical Overview: Developer Observatory

- Infrastructure handles creating VMs and collecting data
- Participant VM spun up for each participant

# Technical Overview: NERDS

- Major overhaul: change to Docker containers
- Improved **scalability** and **adaptability**, while maintaining other reqs.

# Requirements - Review

<b>Participant Experience</b>	<b>Experimental</b>	<b>Technical</b>
<ul style="list-style-type: none"><li>• Non-invasive</li><li>• Flexibility</li><li>• Skip-revisit</li></ul>	<ul style="list-style-type: none"><li>• Randomization</li><li>• Control</li><li>• Real-world</li><li>• Data collection</li><li>• Ethics</li></ul>	<ul style="list-style-type: none"><li>• Isolation</li><li>• Scalability</li><li>• Adaptability</li></ul>

# NERDS Features

- Totally browser-based system: only requirement is an up-to-date web browser (**non-invasive**)
- Participant instances are persistent, cookies used to return user to their instance (**flexibility**)
- Development environment is pre-installed and the same across all participants (**control**)
- System assigns conditions randomly to users and pre-loads instances with required files (**randomization**)
- System automatically collects data in *db* with a pseudonymous identifier (**ethics**)
- Containers are isolated from each other and the infrastructure (**isolation**)

# Case studies

# Case Study: Python study

Used in *Write, Read, or Fix? Exploring Alternative Methods for Secure Development Studies* at SOUPS 2024

- Remote study in Python
- Task-based
- Read, write, and fix conditions with two different libraries – total of 6 conditions
- Only write and fix should be able to edit and run code

# Participant Instance – Technical Detail

- Modified **participant instance** slightly from Stransky et al.
  - arbitrary number of tasks and sub-tasks
- 141 participants over 1 year period

The screenshot shows a web-based task interface. At the top, it says 'tasks (unsaved changes) Current task progress: 2 out of 5' and has a Python logo. The first task is 'Add Two Numbers'. The instructions state: 'Your goal for this task is to write a function `add_two` that, given two numbers as arguments, returns their sum. A function prototype and testing code has been provided for your assistance.' Below the instructions is a code editor with the following code:

```
In [1]: ▶ 1 def add_two(n1, n2):
2         return n1+n2
3
4 # Testing code below
5 assert add_two(2, 3) == 5, "2 + 3 = 5"
6 assert add_two(5, 6) == 11, "5 + 6 = 11"
7 assert add_two(0, 0) == 0, "0 + 0 = 0"
8 print "All tests passed!"
```

The output of the code is 'All tests passed!'. Below the code editor are three buttons: 'Run' (green), 'Stop' (red), and 'Reset' (orange). The second task is 'Hello World'. The instructions state: 'Your goal for this task is to get python to print "Hello World!" without the quotes. Please do not use any external sources for this task.' Below the instructions is a code editor with the following code:

```
In [0]: ▶ 1 # Place your code here
```

Below the code editor are three buttons: 'Run' (green), 'Stop' (red), and 'Reset' (orange). At the bottom right of the interface are two buttons: 'Skip Task' and 'Next Task'.

# Case Study: Python study – Lessons Learned

## Things that worked well

- Conducting a remote study was far easier than an in-person study
- Maintained validity
- Large sample size

## Things that didn't work well

- Some key insights were missed
- Participants can work around the restrictions of the system

# Case Study: C study

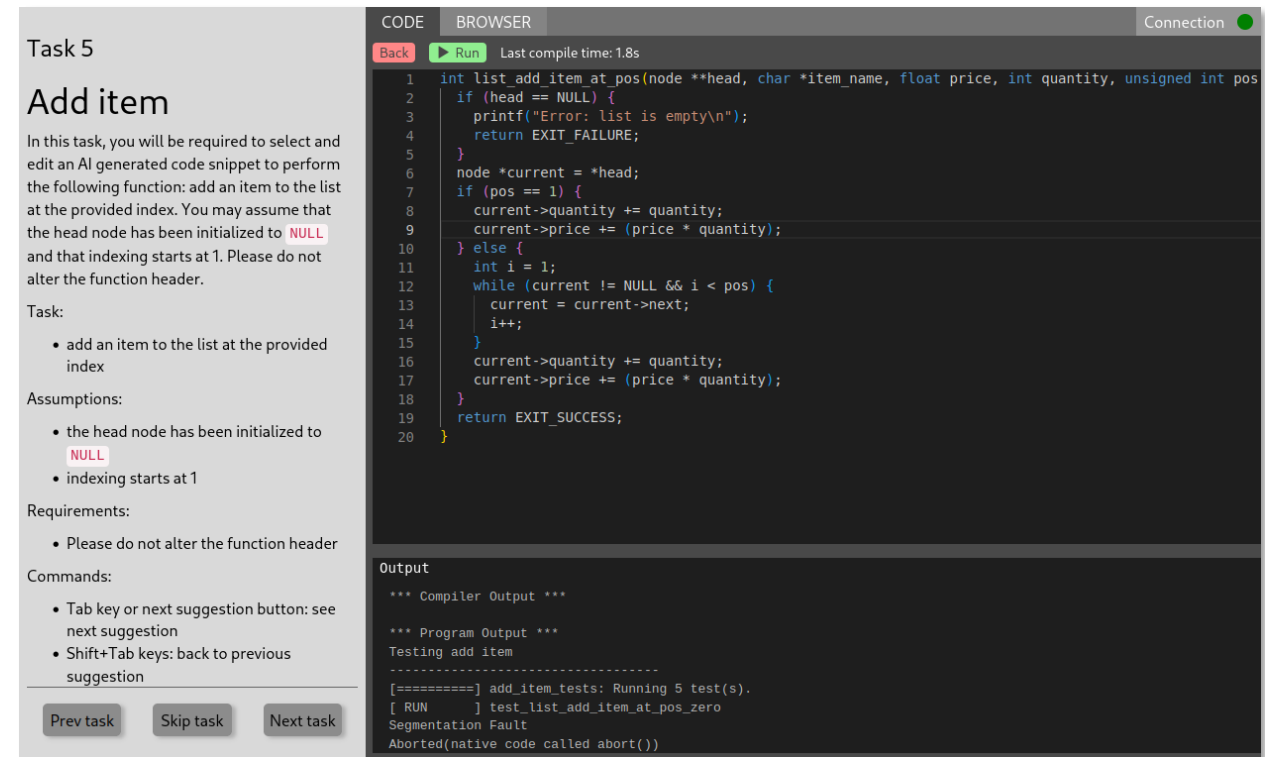

- Requirements – same as NERDS system plus...
  - Coding in C instead of Python
  - Collect participant search history
- Redesigned participant instance to support C language and a remote browser
- Currently on-going

# Requirements - Review

<b>Participant Experience</b>	<b>Experimental</b>	<b>Technical</b>
<ul style="list-style-type: none"><li>• Non-invasive</li><li>• Flexibility</li><li>• Skip-revisit</li></ul>	<ul style="list-style-type: none"><li>• Randomization</li><li>• Control</li><li>• Real-world</li><li>• Data collection</li><li>• Ethics</li></ul>	<ul style="list-style-type: none"><li>• Isolation</li><li>• Scalability</li><li>• Adaptability</li></ul>

# Participant Instance – Technical Detail

- New C development environment
  - Based on Visual studio code (**real-world**)
- New WebAssembly C runtime
  - No code runs on participant instance (**isolation, scalability**)
- New built-in browser
  - Runs in container, displayed through noVNC (**non-invasive, flexibility**)

The screenshot displays a development environment with two main panels. The left panel, titled 'Task 5', contains instructions for an 'Add item' task. It specifies that the user must select and edit an AI-generated code snippet to add an item to a list at a given index. Assumptions include that the head node is NULL and indexing starts at 1. Requirements state that the function header should not be altered. The right panel shows a code editor with a C function named 'list\_add\_item\_at\_pos'. The code includes a check for an empty list, a loop to traverse the list to the specified position, and logic to add a new node with the given name, price, and quantity. Below the code editor is an 'Output' window showing compiler output and program output, which includes a segmentation fault error message: 'Segmentation Fault Aborted(native code called abort())'.

```
Task 5
Add item
In this task, you will be required to select and edit an AI generated code snippet to perform the following function: add an item to the list at the provided index. You may assume that the head node has been initialized to NULL and that indexing starts at 1. Please do not alter the function header.

Task:
  • add an item to the list at the provided index

Assumptions:
  • the head node has been initialized to NULL
  • indexing starts at 1

Requirements:
  • Please do not alter the function header

Commands:
  • Tab key or next suggestion button: see next suggestion
  • Shift+Tab keys: back to previous suggestion

Prev task Skip task Next task
```

```
CODE BROWSER Connection
Back Run Last compile time: 1.8s
1 int list_add_item_at_pos(node **head, char *item_name, float price, int quantity, unsigned int pos)
2   if (head == NULL) {
3     printf("Error: list is empty\n");
4     return EXIT_FAILURE;
5   }
6   node *current = *head;
7   if (pos == 1) {
8     current->quantity += quantity;
9     current->price += (price * quantity);
10  } else {
11    int i = 1;
12    while (current != NULL && i < pos) {
13      current = current->next;
14      i++;
15    }
16    current->quantity += quantity;
17    current->price += (price * quantity);
18  }
19  return EXIT_SUCCESS;
20 }
```

```
Output
*** Compiler Output ***

*** Program Output ***
Testing add item
[=====] add_item_tests: Running 5 test(s).
[ RUN      ] test_list_add_item_at_pos_zero
Segmentation Fault
Aborted(native code called abort())
```

# Participant Interface – Remote Browser

## Task 5

### Add item

In this task, you will be required to select and edit an AI generated code snippet to perform the following function: add an item to the list at the provided index. You may assume that the head node has been initialized to `NULL` and that indexing starts at 1. Please do not alter the function header.

Task:

- add an item to the list at the provided index

Assumptions:

- the head node has been initialized to `NULL`
- indexing starts at 1

Requirements:

- Please do not alter the function header

Commands:

- Tab key or next suggestion button: see next suggestion
- Shift+Tab keys: back to previous suggestion

# Case Study: C Study – Lessons Learned

## Things that worked well

- Switching participant instances was easy – though development cost was high

## Things that didn't work well

- Embedded browser may not be convenient to use
- Be careful with production systems 😊

# How YOU can use NERDS

- All code is released open source on <https://joelewiss.github.io/nerds>
- Both participant instances are released for Python and C
- Documentation on website
- Developing custom instances
- We would **love** to hear from you if you're interested in using our system

# Key Takeaways

- NERDS is a **flexible, open source** system for hosting remote developer studies
- Tested in production with multiple types of studies
- Provides observable advantages to in-person studies **with key tradeoffs**
- Available for download and use
